

Harmful Biologic Aerosols

It is widely established that drains are reservoirs for microbes and antibiotic residues. It is also clear that microbes in drains and pipes adhere to the surfaces of drains and drainage pipes as microbial biofilms, creating a complex ecosystem of different microbes that are fed by organic and inorganic matter. Drains act as cradles to the emergence of bacteria armed with abilities to resist multiple antibiotics. The development of resistance is probably enhanced at hospitals due to the fact that more bacteria and more antibiotics are flushed down the drains due to the very nature of hospitals constantly caring for numerous different patients that are ill and treated with antibiotics.

Thus, biofilm in building drains, not properly maintained, have the potential of spreading even more resistant bacteria. Numerous studies stress the importance of a physical barrier between drainage systems and surroundings. As shown in the SARS outbreak at Amoy Gardens, harmful biologic aerosols can enter the ventilation system from exposed drains and be spread to all the other connected rooms igniting a fearsome spread. It is essential that drainage systems must be completely tight and intact where openings have physical barriers.

The Green Drain can help to prevent potentially fatal cross contamination and infection spread caused by unprotected drains. The Green Drain is an economical Drain Trap Seal Device that allows water to flow down the drain while preventing Pests, Odors, and Harmful Gases/Pathogens from infiltrating the living or work space.

Green Drain™

waterless trap
for floor drains

Prevents

- Drain Odors
- Pest Infiltration
- Sewer/Radon Gas Infiltration
- Harmful Biologic Aerosols

Product Features

- One way drain valve
- Ease of installation
- Does not impair flow rate

Product Benefits

- Increases Indoor Air Quality
- Protects the Public Health

- Does not impair plumbing maintenance
- Provides sewage back-flow protection
- Universal Plumbing Code Certified
